

GUIDLER PACKAGE

On all conveying systems it is important that the belt is properly aligned at the loading point. When the conveyor belt is aligned properly under the load point the material will be loaded in the center of the belt, which will keep the belt tracking correctly throughout the conveyor run. Proper belt alignment is also a very important element to an effective skirtboard system. A centered load will help stop material from spilling off the belt.

Installing a DCI Guidler package will allow proper belt alignment to be maintained. DCI has developed a mounting assembly that allows for easy installation and guidler adjustment.
