

DCI PROTECTOR PLATE

DCI Protector Plate is designed and installed to ensure that the material is contained on the belt and not allowed to spill onto the floor and equipment. The protector plate has a slight break along the bottom edge, which allows for a dead air space and clean out area between the Pos-A-Seal Skirtboard and Protector Plate.

The plate is installed close to the belt to ensure that the material flow is directed away from the skirting rubber. Skirtboard rubber is not intended to contain the majority of the material but rather the small fines and dust. With our protector plate design and installation procedure the plate and the rubber work together to provide a spillage free transfer area.

DCI stocks AR400 protector plate but can supply other types of materials to meet the needs of the customer. Stock plate is 3/8" thick and comes in 48"L X 8"H sections.

Remember: Protector plate and how it is installed is very important to an effective skirtboard system. Let DCI clean up your material handling system.
